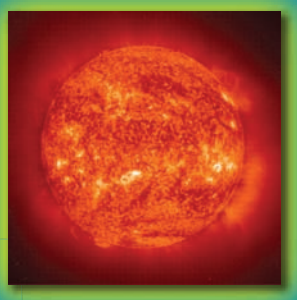
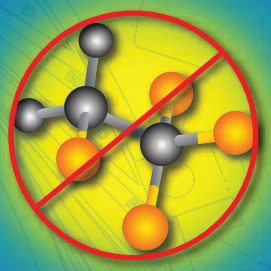
CLIMATE AND THE ADVANCED PHOTON SOURCE

Increased reliance on solar energy would reduce consumption of fossil fuels and limit climate-changing gases. Use of silicon-based solar cells will accelerate when manufacturers can reduce costs while working around the shortage of high-quality silicon. Research at the Advanced Photon Source (APS) at Argonne, and the Advanced Light Source at Lawrence Berkeley National Laboratory (both of which are U.S. Department of Energy laboratories) has shown that an inexpensive form of silicon has potential as a component of commercially viable solar cells.



Amid growing awareness of climate change as a concern in need of rapid solutions, researchers from the U.S. Department of Energy's Argonne and Ames national laboratories, and the University of Iowa, are using the APS to learn more about the functioning of magnetocaloric materials. These have potential for wide application in, among other things, environmentally friendly magnetic refrigeration systems that are not dependent on hydrofluorocarbons (such as tetrafluoroethane, shown in 3-D structure at right), and could reduce the adverse environmental impact of conventional, gas-based refrigeration.



A catalyst that could aid in eliminating nitrogen-oxide emissions from diesel exhausts has been developed by Argonne researchers with the help of the APS. Several companies have expressed interest in licensing and scaling up the technology to bring it to market. The catalyst is one of several that also show promise for reducing nitrogen-oxide emissions from industrial sources such as coal-fired power plants, and refinery and chemical-plant furnaces.

See other side for more information

The Advanced Photon Source at the U.S. Department of Energy's Argonne National Laboratory provides this hemisphere's brightest x-ray beams for research. Scientists and engineers using the APS help assure a bright future for our nation by carrying out research that promises to have far-reaching impact on our technological and economic competitiveness, our health, and our fundamental knowledge of the materials that make up our world.

Argonne is a U.S. Department of Energy laboratory managed by UChicago Argonne, LLC
The Advanced Photon Source at Argonne National Laboratory is funded by the U. S. Department of Energy, Office of Science, Office of Basic Energy Sciences

This work was funded by NREL and the AG-Solar project of the government of Northrhein-Westfalia sNRWd, funded through the Fraunhofer Institute for Solar Energy Systems Germany and the Deutsche Forschungsgemeinschaft. Operations of the Advanced Light Source at Lawrence Berkeley National Laboratory are supported by the Office of Science, Office of Basic Energy Sciences, Materials Sciences Division, of the U.S. Department of Energy (DOE). PNC-CAT facilities at the Advanced Photon Source, and the research at these facilities, are supported by the DOE Office of Science, the University of Washington, a major facilities access grant from NSERC, Simon Fraser University, and the Advanced Photon Source. Use of the Advanced Photon Source was supported by the U.S. Department of Energy, Office of Science, Office of Basic Energy Sciences.
